## **Abstract:**

Ameloblastoma is one of the most common odontogenic tumors with benign but aggressive clinical features. It represents 1% of all tumors of jaw bone. Though it is characterized by wide variety of histologic appearance, it does not generally show evidence of induction in the connective tissue.

Here we report of case of unicystic ameloblastoma in 28 year old female, which showed evidence of induction in the form of dentinoid and tubular dentin formation.

**Keywords:** Ameloblastoma, Dentinoid, Induction.
